                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (GPCR)
```

The present invention relates to a new G-protein coupled receptor (GPCR) peptide. The invention is useful for identifying a modulator of GPCR and for treating a disease or condition mediated by a human protease. The invention is also useful as models for the development of human therapeutic agents, and as guery sequence to perform a search against sequence databases to, for e.g., identify other family members of related sequences. The vector of the invention is useful for producing a GPCR protein or peptide, for conducting cell-based assays involving the GPCR protein or peptide, for or identifying GPCR protein mutants whose functions are affected, and to produce non-human transgenic animals. The present nucleic acid sequence represents the human G-protein coupled receptor (GPCR) gene located on chromosome 3. This sequence encodes the human G-protein coupled receptor (GPCR) protein of the Claim 4; Fig 3; 75pp; English

                                                                                                                          The invention relates to Mrg (mas-related gene) protein, which is a G-
protein coupled receptor and drg-12 protein, which is a receptor. The
invention is useful for identifying compounds that bind to it, especially
agonists or antagonists. Administration of an agent (e.g. the identified
agonist) that increases the expression of Mrg in a mammal may be used for
treating impaired sensory perception in a mammal, especially pain. The
antagonist may also be useful for treating impaired sensory perception in
a mammal. The present sequence is human MrgX3 DNA
                                                                                                 Sequence 1400 BP; 276 A; 375 C; 363 G; 386 T; 0 U;
                                                                                                                                                                                                                                                                 Isolated polypeptide, Mrg, which is a G-protein coupled receptor isolated polypeptide, drg-12, which is also a receptor, useful for identifying agonists or antagonists for treating pain.

New isolated antigenic peptides e.g., for G protein-coupled receptors (GPCR), useful for diagnosing and designing drugs for treating conditions in which GPCRs are involved, e.g. AIDS, Alzheimer's disease, cancer or

Disclosure; Fig 1; 523pp; English

The present invention describes antigenic peptides (1) comprising: (a) CC any one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino CC acids. Also described: (1) an assay for the detection of a particular GC protein-coupled receptor (GPCR) or a candidate polypeptide in a sample; CC and (2) an isolated antibody having high specificity and high affinity or CC avidity for a particular GPCR. (1) can be used as GPCR modulators and in CC gene therapy. The antigenic peptides for GPCRs are useful in detecting an CC antibody against a particular GPCR, and in the production of specific CC antibodies. The peptides and antibodies are also useful for detecting the CC presence or absence of corresponding GPCRs. The antigenic peptides for CPCRs and antibodies are useful for diagnosing and designing drugs for CC treating immune-related diseases, growth-related diseases, cell CC diseases, or autoimmune diseases, growth-related cell proliferative CC diseases, or autoimmune disease, growth-related cell proliferative CC diseases, bacterial, fungal, protozoan or viral infections, costeoarthritis, osteoporosis, cancer, cardiomyopathy, chronic and acute CC inflammation, allergies, Crohn's disease, diabetes, graft versus host CC disease, Parkinson's disease, multiple sclerosis, pain, psoriasis, cancer, peptides, pain, psoriasis, cancer, pain, psoriasis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to an isolated mas-related gene D (MrgD) polypeptide. The MrgD polypeptides are useful as therapeutics or for identifying compounds, i.e. agonists or antagonists, that alter pain perception in a mammal. The compounds are useful for treating impaired sensory perception, e.g. chronic intractable pain or neuropathic pain, promoting wound healing, restoring normal sensitivity following injury, or treating ocular conditions, particularly those associated with pressure such as glaucoma. The Mrg genes or proteins may be used as molecular probes for the detection of cells or tissues related to or involved with sensory perception. The present sequence represents a MrgA (Mrg subfamily) encoding sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New mas-related gene D polypeptides, useful as therapeutics or in identifying agonists or antagonists that alter pain perception in a mammal for treating impaired sensory perception, e.g. chronic intractable pain or neuropathic pain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          mas-related gene D; MrgD; Analgesic; Vulnerary; Ophthalmological;

A polynucleotide of the invention may have a use in gene therapy. The polynucleotide and polypeptide are useful for preparing a composition for treating a patient in need of increased or suppressed activity or expression of the guanosine triphosphate-binding protein coupled receptor. The polynucleotide sequences shown in ADC85548-ADC87616 encode GPCR's of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polynucleotide, useful for preparing a composition for treating a patient in need of increased or suppressed activity or expression of t guanosine triphosphate-binding protein coupled receptor.

The invention relates to Mrg (mas-related gene) protein, which is a G-protein coupled receptor and drg-12 protein, which is a receptor. The invention is useful for identifying compounds that bind to it, especially agonists or antagonists. Administration of an agent (e.g. the identified agonist) that increases the expression of Mrg in a mammal may be used for treating impaired sensory perception in a mammal, especially pain. The antagonist may also be useful for treating impaired sensory perception in a mammal. The present sequence is human MrgX4 DNA
                                                                                                                                                                                                                                                                     Isolated polypeptide, Mrg, which is a G-protein coupled receptor and isolated polypeptide, drg-12, which is also a receptor, useful for identifying agonists or antagonists for treating pain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  04-MAY-2000; 2000US-020207P.

The present invention describes antigenic peptides (I) comprising: (a) any one of 1601 sequences (see ABP82019 to ABP3519) of 12-24 amino CC acids. Also described: (1) an assay for the detection of a particular GC protein-coupled receptor (GPCR) or a candidate polypeptide in a sample; CC and (2) an isolated antibody having high specificity and high affinity or avidity for a particular GPCR. (I) can be used as GPCR modulators and in CC gene therapy. The antigenic peptides for GPCRs are useful in detecting the CR antibodies. The peptides and antibodies for GPCRs are useful for detecting the CC presence or absence of corresponding GPCRs. The antigenic peptides for CPCRs and antibodies are useful for diagnosing and designing drugs for CR GPCRs and antibodies are useful for diagnosing and designing drugs for treating immune-related diseases, growth-related diseases, call corresponding GPCRs. The antigenic peptides for CR diseases, or autoimmune diseases, growth-related diseases, call corresponding and designing drugs for cost atherosclerosis, bacterial, fungal, protozoan or viral infections, cost atherosclerosis, bacterial, fungal, protozoan or viral infections, can atherosclerosis, bacterial, fungal, protozoan or viral infections, can atherosclerosis, bacterial, fungal, protozoan or viral infections, can atherosclerosis, bacterial, fungal, protozoan or viral infections, cost disease, parkinson's disease, multiple sclerosis, paraft versus host cost disease, parkinson's disease, multiple sclerosis, paraft versus host cost protosoan, can atherosclerosis, cancer, cardiomyopathy, chronic and acute cost parafty, depression, schizophrenia, dementia, mental retardation, memory cost parafty, and sease, and immunociasoays and immunociasoays, abacteria, cancer, cardiomyopathy, parafty versus host cost parafty, parafty par
New isolated antigenic peptides e.g., for G protein-coupled receptors (GPCR), useful for diagnosing and designing drugs for treating conditions in which GPCRs are involved, e.g. AIDS, Alzheimer's disease, cancer or autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure; Fig 1; 523pp; English

The present invention relates to an isolated mas-related gene D (MrgD) polypeptide. The MrgD polypeptides are useful as therapeutics or for identifying compounds, i.e. agonists or antagonists, that alter pain perception in a mammal. The compounds are useful for treating impaired sensory perception, e.g. chronic intractable pain or neuropathic pain, promoting wound healing, restoring normal sensitivity following injury, or treating ocular conditions, particularly those associated with pressure such as glaucoma. The Mrg genes or proteins may be used as molecular probes for the detection of cells or tissues related to or involved with sensory perception. The present sequence represents a MrgA (Mrg subfamily) encoding sequence.

A polynucleotide of the invention may have a use in gene therapy. The polynucleotide and polypeptide are useful for preparing a composition for treating a patient in need of increased or suppressed activity or expression of the guanosine triphosphate-binding protein coupled receptor. The polynucleotide sequences shown in ADC85548-ADC87616 encode GPCR's of the
